

MarkdownTools Master Test Suite

This master markdown document is designed to test all elements of the **Markdown to PDF, HTML, and TXT** converters. It covers typography, layout tables, syntax highlighting, HTML integration, inline CSS styles, custom page breaks, images, and Mermaid diagrams.

Table of Contents

- [1. Typography & Text Elements](#)
- [2. Lists & Task Lists](#)
- [3. Tables & Alignments](#)
- [4. Syntax Highlighting](#)
- [5. Custom Page Breaks & HTML Features](#)
- [6. Mermaid Diagrams](#)
- [7. Visual Media & Images](#)

1. Typography & Text Elements

Testing standard Markdown text structures and heading levels:

Heading 1 (Document Title)

Heading 2 (Major Section)

Heading 3 (Sub-section)

Heading 4 (Sub-sub-section)

Heading 5 (Minor section)

Heading 6 (Detail section)

Here is a paragraph showcasing different text styles:

- This text is **bold** (strong).
- This text is *italic* (emphasis).
- This text combines ***bold and italic***.
- This is a strikethrough text.
- Here is an `inline code block` in the middle of a sentence.
- You can also use [Hyperlinks](#) or [referenced links](#).

Blockquote Test: This is a standard markdown blockquote. It should have a nice left border, rounded corners, and a subtle background color in both the preview and the exported PDF.

Nested Blockquote: You can nest quotes to show replies or secondary references.

2. Lists & Task Lists

Here we test bullet points, ordered indexing, indentation levels, and checklist states.

Unordered Lists (Nested)

- Primary Bullet A
 - Secondary Bullet A1
 - Secondary Bullet A2
 - Tertiary Bullet A2a
- Primary Bullet B

Ordered Lists

1. First step in the process
2. Second step in the process
 1. Sub-step 2a
 2. Sub-step 2b
3. Third step in the process

Task Lists (Checklists)

- Integrate HTML-to-PDF parser (`html2pdf.js`)
- Implement live syntax highlighting (`highlight.js`)
- Add real-time Mermaid diagram compilation (`mermaid.js`)
- Implement cloud-sync backup (Planned feature)
- Add custom page margins in UI settings

3. Tables & Alignments

Tables must align columns correctly and handle cells of varying lengths.

ID	Feature Name	Description	Status	Priority
01	PDF Export	Offline client-side PDF compiler	Active	High
02	Live Preview	Side-by-side split pane render	Active	High
03	Auto-save	Stores content in LocalStorage	Pending	Medium
04	Cloud Sync	Shared web workspace sync	Idea	Low

Note: The table columns are left-aligned, centered, left-aligned, centered, and right-aligned respectively.

4. Syntax Highlighting

This section tests the syntax highlighting library (`highlight.js`) with multiple languages.

Javascript (React Component)

```
import React, { useState } from 'react';

export function Counter() {
  const [count, setCount] = useState(0);

  return (
    <div className="p-4 border rounded-xl bg-slate-50">
      <p className="text-sm font-bold">Current Count: {count}</p>
      <button
        onClick={() => setCount(prev => prev + 1)}
        className="px-3 py-1 bg-indigo-600 text-white rounded-md"
      >
        Increment
      </button>
    </div>
  );
}
```

Python (Data Processing)

```
def calculate_metrics(data_points):
    """Calculate basic statistical metrics for a list of data points."""
    if not data_points:
        return {"mean": 0.0, "count": 0}

    total = sum(data_points)
    count = len(data_points)
    mean = total / count

    return {
        "mean": mean,
        "count": count,
        "sum": total
    }

# Test the function
print(calculate_metrics([12, 15, 18, 22, 25]))
```

CSS Variables

```
:root {
  --primary-color: #6366f1;
  --secondary-color: #4f46e5;
  --bg-gradient: linear-gradient(135deg, #e0e7ff 0%, #f3f4f6 100%);
  --border-radius: 8px;
```

```
--box-shadow: 0 4px 6px -1px rgba(0, 0, 0, 0.1);  
}
```

5. Custom Page Breaks & HTML Features

This section tests the parser's compatibility with standard HTML elements inside Markdown.

Page Breaks

To force a page break in the PDF export, you can place a `<div style="page-break-after: always;"></div>` tag directly in your Markdown file. The pages before and after this section should split cleanly.

Styled Badges & Inline Elements

You can write custom HTML badges like this:

- Status: **COMPLETED**
- Priority: **CRITICAL**
- Theme: **GLOWING-DARK**

Accordions & Dropdowns

Using the HTML `<details>` and `<summary>` tags:

 Click to expand troubleshooting instructions

If diagrams do not render properly in the PDF export, verify that they are correctly written in ````mermaid` block tags and that no syntax errors are present in the diagram definition.

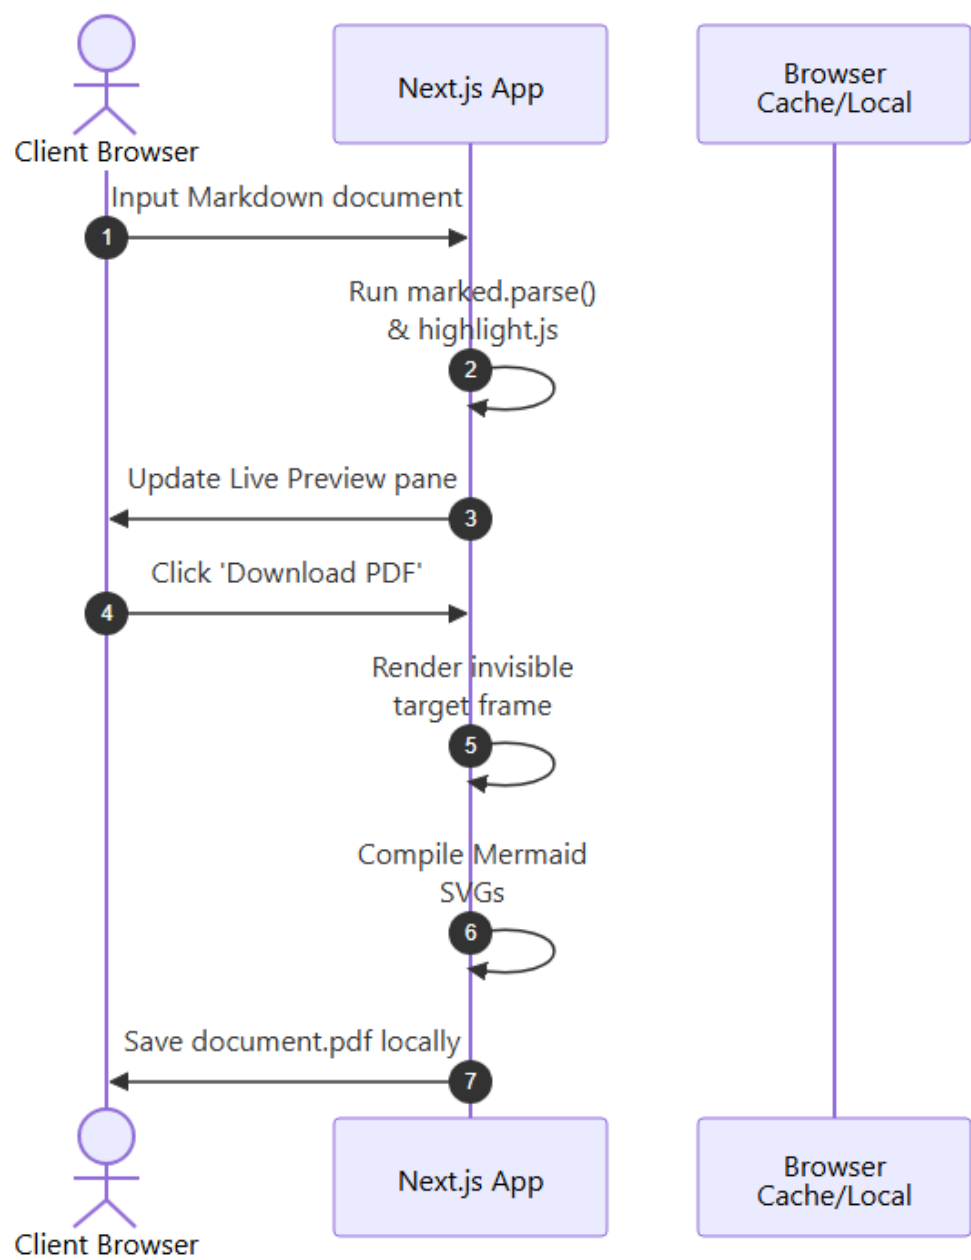

6. Mermaid Diagrams

These interactive diagrams are compiled live. They must scale correctly and avoid page clipping during PDF conversion.

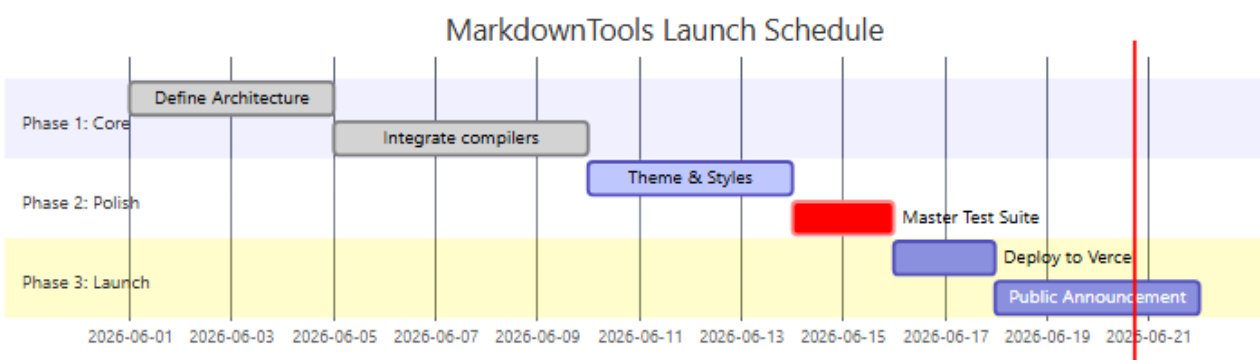

A. Process Flowchart (Horizontal)

B. User Authentication (Sequence Diagram)

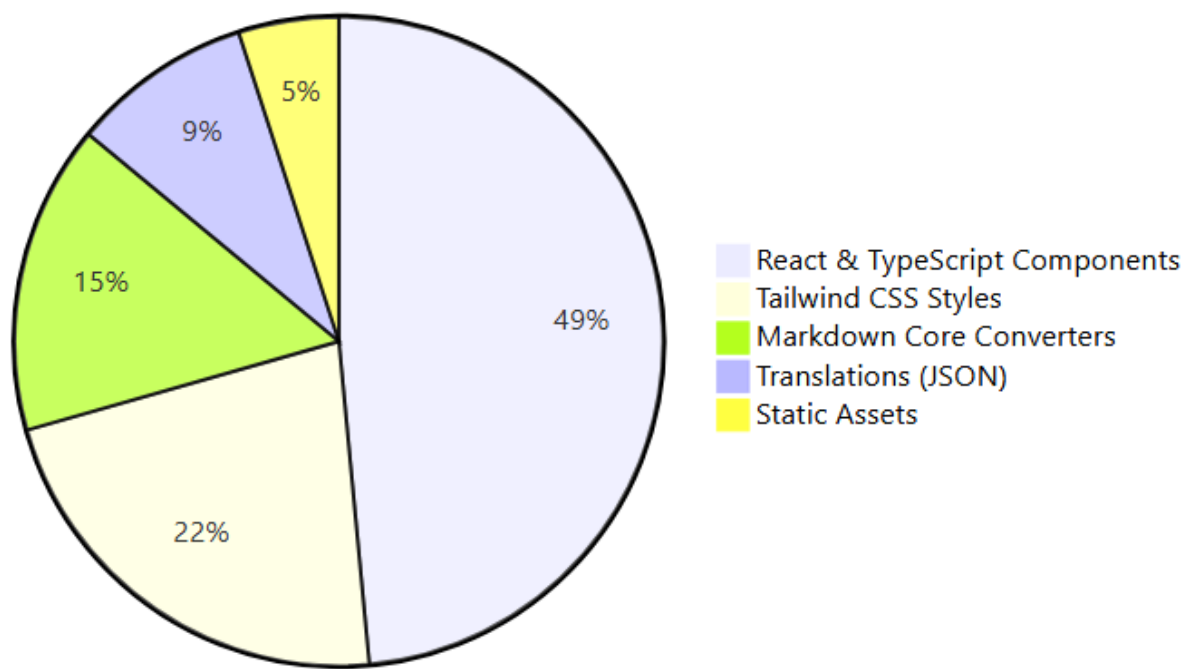

C. Project Launch Timeline (Gantt Chart)

D. System Distribution (Pie Chart)

MarkdownTools Codebase Distribution

7. Visual Media & Images

This section tests how both local and external images are rendered and styled.

A. Local Project Asset (Glow Banner)

Below is the generated vector logo banner representing MarkdownTools. It is loaded locally from the public directory.

MarkdownTools Banner

B. External High-Resolution Photograph

This photo is fetched dynamically from Unsplash to test remote asset resolution, scale matching, and CORS handling.
